

General Notes

• The responses now tend to combine citing data in text, explaining and building up reasoning before stating the conclusion. That's a bad strategy. It violates these rules:

1. Numbers should be used sparingly. They should be presented graphically as a general rule

2. The job of ChatGPT is to suggest a conclusion / inference based on data analysis, and provide the user with the information used to arrive at it so that the user can determine if they think it is valid and/or useful. Explaining the reasoning chain instead of the high-level inference, provided the supporting information is given together with it, is going against that

3. Assume that the player is at least an intermediate player. They may request a follow-up, but if presented with a conclusion and support, they can infer the reasoning process much quicker than they can read it written out

Cont.

• Remove whatever instruction is causing the response to always state something at the end of the initial answer

Unit expert — prompts, final outputs, and tool arguments

Run date: October 4, 2026 (started 15:39:07 UTC). Run ID: [adea170a7b476b85](#). Dataset: [unit-expert](#); assistant: [unit_expert](#).

All 17 cases returned final answers. Grading: 12 passed, 5 failed.

Each case contains the exact prompt used in this run and its complete recorded final response, followed by tool calls in recorded order. Arguments are formatted as Markdown; all fields, including explicit nulls, are retained. Tool return values are omitted. Nothing was rerun.

Sources: the archived October 4 job record and tool traces recovered from preserved Langfuse observation metadata.

UN4-1-C01

Prompt

What separates a Veigar reroll carry board from a board that just uses him for traits? How much do his items and the rest of the team change whether three-star Veigar is worth building around?

Final output

Practical read: Three-star Veigar is a real commitment signal, but it is not a carry verdict by itself. In the active analysis scope, three-star Veigar boards do better than two-star Veigar boards; within the three-star group, however, outcomes barely clear the lobby baseline overall. The clearest positive signals are **substantial item investment on Veigar and a more developed team—especially stronger trait tiers and higher-level boards.** These are associations, not proof that Veigar or any one teammate caused the result.

Composition definition and sample

No fixed trait shell was specified, so I'm using **boards with Veigar at three stars** as the operational "reroll carry" cohort, and comparing them with boards containing two-star Veigar. The active analysis scope contains **192,344 boards**. There are **5,660** three-star-Veigar boards and **1,842** two-star-Veigar boards.

Remove
This is always true

Remove. Don't need to remind the player about this

Unit	Cost	Presence in three-star Veigar boards	Outcomes in those boards	Read
Veigar	1	5,660 boards; versus 1,842 two-star boards	Three-star: 4.58 avg placement, 48% top four, 10% wins (5,660). Two-star: 5.01, 40%, 8% (1,842). Three-star minus two-star: -0.42 placement, +8 pp top four, +3 pp wins .	Building to three stars is associated with a meaningful improvement over stopping at two. But 4.58 is still a little worse than the 4.5 lobby baseline: three stars alone do not establish a successful carry board.
Rek'Sai	1	5,246 boards (93%)	4.59 avg placement, 48% top four, 10% wins (5,246).	Near-standard shell presence; consistent with frontline-anchor allocation, but its cohort average is not evidence of an independent effect.
Fiddlesticks	3	4,880 boards (86%)	4.51 avg placement, 50% top four, 11% wins (4,880).	Also a frequent frontline-anchor piece. The board data supports common inclusion, not a claim that Fiddlesticks is what makes the reroll work.
Gnar	5	2,182 boards (39%)	3.39 avg placement, 72% top four, 19% wins (2,182).	Much less common than the core shell pieces, but associated with notably stronger results. Read this as a cap-board signal , not proof Gnar itself is the cause or a required reroll unit.

What separates the carry-looking boards

Stars matter, but don't settle the question. Three-star Veigar's comparison against two-star Veigar is favorable, yet the three-star cohort's overall placement is still **4.58 (5,660 boards)**. The gap between "Veigar reached three stars" and "the board is performing well" is substantial.

Items sharpen the carry read. Among three-star Veigar boards, Veigar holding at least two completed items is associated with **4.57 placement, 49% top four, 10% wins** (5,485 boards); the zero-to-one-item group is **5.16, 36%, 4%** (181 boards). Target-minus-baseline differences are **-0.59 placement, +12 pp top four, +7 pp**

Not useful
omit

Good for internal reasoning, but does not belong in the answer like this

wins. Treat that contrast cautiously: the underitemized group is small, and the tool reported a small, suppressed cohort overlap.

- **The item pattern is focused, not one fixed recipe.** Jeweled Gauntlet appears on Veigar in **4,826 boards** and Blue Buff in **3,465**. The most common exact three-item loadout on three-star Veigar is **Blue Buff + Flora Fatalis Emblem + Jeweled Gauntlet: 913 boards, 4.24 placement, 56% top four, 11% wins**. Other three-star loadouts vary considerably in outcomes, so one item combination is not a universal pass/fail test.

The rest of the board changes the read. Within three-star Veigar boards, Flora Fatalis at **Gold** is present on **2,262 boards** with **4.16 placement and 57% top four**, while **Bronze** is present on **2,655 boards** with **4.80 placement and 44% top four**. And by board level, the three-star-Veigar cohort goes from **6.04 placement / 19% top four at level 7 (1,598 boards)** to **4.50 / 50% at level 8 (2,135)** and **2.78 / 83% at level 9 (1,428)**. That level-9 result is strongly selected for boards that got further ahead; it is not an estimate of the causal benefit of leveling.

Bottom line: I'd call Veigar a build-around candidate when the board actually invests in him—especially items—and develops the surrounding team, not merely because he happens to be present for traits. The common Rek'Sai/Fiddlesticks shell describes what three-star-Veigar boards often contain; the stronger trait tiers and high-level Gnar boards are more suggestive of where the successful, higher-cap versions separate. Final-board snapshots cannot tell us when Veigar was acquired, the roll timing, or whether he was the early-game plan.

UN4-1-C02

Prompt

With Flickerblade, radiant Quicksilver and Edge of Night, is two-star Master Yi or one-star Draven the better carry? How much does the rest of the board change that?

Final output

Practical read: With this exact three-item setup, the data can't choose a winner: the full-build comparison has **0 boards**. On the closest reportable proxy—each unit holding **Flickerblades**, without confirming the other two items—**2★ Master Yi and 1★ Draven are essentially tied and both perform poorly**. The rest of the board appears capable of changing the result substantially, but this sample can't separate that effect from star level and board selection.

Scope and evidence

The operational comparison is the two requested unit/star combinations in the active analysis store (**192,344 boards**), with item-held results used as proxies—not a defined trait or unit shell. There are **3,969 boards with Flickerblades** store-wide. The exact three-item, exact holder comparison returned **0 boards**. Radiant Quicksilver appears on **186 boards** overall, but there are no reportable unit/star rows for it; the store's minimum is **50 boards**.

Candidate	Cost; evidence	Flickerblades-held results	Read
Master Yi, 2★	3-cost; 138 boards	Avg placement 6.14 , top-four 17% , wins 1% (all on 138 boards)	No evidence here that this is a successful carry; poor results on the reportable item proxy.
Draven, 1★	5-cost; 224 boards	Avg placement 6.15 , top-four 20% , wins 2% (all on 224 boards)	Essentially the same poor result as Yi in this proxy.

Both averages are well below the 4.5 lobby baseline. These are **suggestive** samples, not proof about the requested three-item setup. Yi's separate Edge of Night-held **2★** sample is also poor: **906 boards**, average **6.22**, top-four **15%**, win **1%**. That still does not establish the full build; Draven has no reportable **1★** Edge of Night row.

Only this Part stays: Insurmountable Limitation State Plainly Here let the user follow up.

The rest-of-board signal is large, but not isolatable: Draven at 2★ with Flickerblades has **352 boards** at average placement **3.01**, top-four **75%**, win **37%**. Compared with 1★ Draven holding Flickerblades, that is a **3.14-placement** improvement and a **55-point** top-four increase. But this changes star level too, and final-board snapshots can't tell whether the better boards reflect the rest of the composition, investment, or selection. It does show why the 1★ Draven read shouldn't be generalized to upgraded Draven boards.

Bottom line: I wouldn't pick either as the better carry from the requested three-item evidence; it isn't present at reportable volume. The nearest matched-item comparison is a practical tie, while the strong 2★ Draven result signals that upgrade/board context can matter a lot—not that the rest-board effect has been measured.

UN4-1-C03

Prompt

Does three-star Veigar with normal items still have a strong endgame, or do Dawncore and Flora Fatalis versions account for most of his top finishes?

Final output

Short read: Three-star Veigar without Dawncore is common, but the broad no-Dawncore-on-Veigar group does **not** look like a strong finisher; it averages 4.67, below the 4.5 lobby baseline. A common standard-item build is similar. Flora Fatalis is present on most three-star Veigar boards and is associated with better results. Dawncore on Veigar is a much smaller group with the strongest broad comparison, but it accounts for only about 12% of three-star Veigar top fours—not most of them.

Scope: Boards with **three-star Veigar**, with no additional composition or level restriction; **5,660 boards**. Veigar is a 1-cost unit. These are final-board associations, not causal effects.

I like the ideas here, but here is a much better version:
Three-star veigar without Dawncore is lower, but averaged a ~~4.67~~ 4.62
A callout trait is Flora Fatalis. It has a significant sample size but still posts strong results

Three-star Veigar cohort	Boards	Avg. placement	Top four	Wins
Dawncore held by Veigar	487	3.67	66%	22%
No Dawncore held by Veigar	5,173	4.67	47%	9%
Flora Fatalis active	4,917	4.51	50%	11%

Three-star Veigar cohort	Boards	Avg. placement	Top four	Wins
Flora Fatalis inactive	743	5.08	39%	7%

- **Dawncore is a real standout, not the majority explanation.** Compared with three-star Veigar boards where Veigar does not hold Dawncore, the Dawncore group is **1.00 placement better**, with **+19 percentage points top-four rate** and **+13 points win rate**. Those are observational differences. From the placement histograms, Dawncore Veigar appears on 321 top-four boards and 107 first-place boards; that is about **12% of all three-star Veigar top fours** and **19% of its wins**.
- **Flora Fatalis is the more prevalent signal.** It is active on 4,917 of 5,660 boards, and its group contains about **89% of three-star Veigar top fours**. Within the three-star Veigar population, Flora-active boards average 4.51 versus 5.08 when inactive. That says the trait-active version is better associated with results, but the active cohort is only around lobby-average placement overall.
- **Standard items can finish, but the representative build isn't a standout.** Veigar with **Blue Buff + Hextech Gunblade + Jeweled Gauntlet** appears on **313 boards**, averaging **4.62**, with a **47% top-four rate** and **10% win rate**. That's a meaningful sample, but not evidence of strong endgame performance on its own.
- The most common exact three-item Veigar loadout is **Blue Buff + Flora Fatalis Emblem + Jeweled Gauntlet: 913 boards, 4.24 average, 56% top-four, 11% wins**. That supports the emblem build as a notable itemized version, but it doesn't show that all Flora-active boards use that loadout.

Bottom line: Don't write off three-star Veigar without Dawncore, but the broad no-Dawncore group and a common standard-item build are not strong by placement. Flora Fatalis accounts for most of his observed volume and top fours; Dawncore-on Veigar has the sharper outcome signal, but remains a minority of boards and top finishes. The Dawncore and Flora groups can overlap, so their contributions shouldn't be added together.

Tool trace — arguments only

1. `resolve_tft_names`
 - `names:` Veigar; Dawncore; Flora Fatalis (ordered list)
2. `compare_cohorts`
 - `target:`
 - `unit_conditions:`
 - Item 1:
 - `name:` Veigar
 - `star_level:` 3

The first part's good. Drop See Part entirely — half-redundant, the other half isn't useful

Better Version: Non-Dawncore Veigar is not strong by Avg. Placement (4P.67). Dawncore on Veigar has a

Smaller Sample (~500 v.s. ~5000) but much better Placement (3.62) as a key Part of successful boards. Flora Fatalis also emerges

All should be graphic

UN4-1-C04

Prompt

On finished three-star Veigar boards, how do Ornn-focused, Alistar-focused and split frontline investment compare?

Final output

Practical read: Alistar-only boards have the best observed placement and top-four rate. Splitting the frontline between Ornn and Alistar is common, but its overall results are weaker than Alistar-only. The split's comparison with Ornn-only is inconclusive; the Ornn-only sample is small.

Composition definition and scope

I treated a "finished three-star Veigar board" as a board with **Veigar at exactly 3★**, with no item requirement. "Ornn-focused" means Ornn present and Alistar absent; "Alistar-focused" means the reverse; "split" means both present. These definitions do **not** rule out other frontline units or require either unit to be itemized.

Frontline pattern	Boards	Avg. placement	Top four	Wins
Ornn-focused	104	4.87 (n=104)	42% (n=104)	8% (n=104)
Alistar-focused	362	4.40 (n=362)	53% (n=362)	9% (n=362)

Frontline pattern	Boards	Avg. placement	Top four	Wins
Split: both	1,254	5.03 (n=1,254)	39% (n=1,254)	11% (n=1,254)

Lower average placement is better; 4.5 is the lobby baseline. The Alistar-focused and Ornn-focused samples are suggestive-sized; the split sample is solid-sized by the store's thresholds.

What the comparison says

- **Alistar-focused vs. Ornn-focused:** Ornn-only boards were worse by **0.47 placement** and **10 percentage points in top-four rate**. The confidence intervals reach zero, so this is a suggestive lean toward Alistar, not a decisive separation.
- **Split vs. Alistar-focused:** split boards were worse by **0.63 placement** (95% CI **+0.39 to +0.88**) and **13 points in top-four rate** (CI **-19 to -7 points**), target minus baseline. The win-rate difference was **+2 points**, with a CI crossing zero.
- **Split vs. Ornn-focused:** split boards were worse by **0.17 placement** and **3 points in top-four rate**, while win rate was **4 points higher**. All three intervals cross zero; this does not establish a reliable difference.

Investment signal

The roster context lists Ornn as a 1-cost and Alistar as a 2-cost. In the grouped records, **Ornn-only** included 67 boards with Ornn at 3★ and 3 items; **Alistar-only** included 100 with Alistar at 3★ and 3 items. In split boards, Ornn at 3★/3 items appeared on 831 boards, versus 420 for Alistar; Alistar at 2★ with no completed items appeared on 448. So “split” often does not mean equally invested frontliners.

Within split boards, the 3★/3-item Alistar row had **3.87 average placement and 61% top four (n=420)**; the corresponding Ornn row had **5.13 and 37% (n=831)**. That's a notable allocation/outcome association, not proof that moving items or investment to Alistar would cause the difference.

Bottom line: If choosing between these observed patterns, Alistar-focused has the clearest placement/top-four edge. Split is not supported as an upgrade over Alistar-focused; its win rate does not clearly separate. Treat the Ornn-only comparison cautiously. These are final-board associations, not controlled tests, and the item data here counts completed-item slots rather than specific item identities.

UN4-2-C01

Prompt

Are AP builds on two-star Nidalee competitive with AD builds, or do they only hold up on certain boards?

Final output

Practical read

AD-marked builds are the safer default; the data does not show AP keeping pace, even in the board contexts checked. The clearest AP marker, Jeweled Gauntlet, is associated with worse results than other two-star Nidalee boards. Rabadon's Deathcap looks roughly neutral, but that is not evidence that AP builds as a whole are competitive.

Scope and comparison

I used **all active-scope boards** (192,344 total) containing **two-star Nidalee**—26,766 boards—as the operational population. Nidalee is a 4-cost unit. I treated Jeweled Gauntlet and Rabadon's Deathcap as AP-build markers and Infinity Edge as an AD-build marker; these are item-based proxies, not a direct read of Nidalee's AP/AD form. The item comparisons below bind the item to Nidalee and compare against the **rest of the two-star Nidalee population**.

Nidalee item marker	Boards	Avg. placement	Top 4	Wins
Jeweled Gauntlet	1,015	4.29	55%	8%
Rabadon's Deathcap	518	3.99	60%	12%
Infinity Edge	14,208	4.00	62%	9%

For **Jeweled Gauntlet**, the remaining 25,751 two-star Nidalee boards averaged **3.97 placement, 62% top four, and 11% wins**. The target-minus-baseline differences were **+0.32 placement** (95% CI +0.19 to +0.45), **-6 percentage points top four**, and **-3 points wins**. For

Although filtering as such will successfully get AP v.s. AD builds, it will not catch the very many boards with Nidalee with neither of those items.

Maybe skill file?

Rabadon's, the other 26,248 boards averaged **3.98, 62%, and 11%**; the observed difference was essentially neutral, with uncertainty too wide to call a meaningful advantage or penalty.

As a more specific build check, **Jeweled Gauntlet + Spear of Shojin** appeared on 217 boards (4.25 placement, 55% top four, 8% wins); **Infinity Edge + Spear of Shojin** appeared on 6,912 (4.01, 62%, 9%). These are separate target-versus-rest comparisons, not a randomized head-to-head. The most common complete loadout returned was **Infinity Edge + Spear of Shojin + Sterak's Gage**, on 3,661 boards (3.87 placement, 65% top four, 9% wins).

Very good -
Controlling
for other
Nidalee variants
w/ the
second query

Does AP work on particular boards?

I don't see a convincing pocket where the Jeweled Gauntlet signal catches up. Within **Blossom** boards, Jeweled Gauntlet Nidalee had a respectable raw 3.54 average placement, 70% top-four rate, and 13% win rate (**370 boards**), but the other two-star Nidalees in that context did better: 3.22, 74%, and 23% (**3,604 boards**). Within **Hunter** boards, the Jeweled Gauntlet group was weaker in raw results too: 4.70, 44%, and 6% (**189 boards**) versus 4.04, 60%, and 10% (**14,514 boards**).

Bottom line: don't treat AP as a proven equal alternative based on these stats. Rabadon's alone is inconclusive; Jeweled Gauntlet, including in the checked board contexts, is not supported as a competitive default. These are final-board associations, not causal item tests, and the available item markers cannot capture every possible AP-oriented build.

UN4-2-C02

Prompt

Does three-star Azir need Shojin, or can I build Guinsoo's plus two damage items? Are there boards where spending that slot on mana looks more worthwhile?

Final output

Practical read: I wouldn't treat Shojin as mandatory on 3-star Azir. Three-item 3-star Azirs holding Guinsoo's Rageblade have a reportable sample; 3-star Azirs holding Shojin do not. So the data supports *Rageblade plus two other completed items as a common option*, but it can't verify that the other two should specifically be damage items—or prove Shojin is worse.

Scope: The composition shell is operationally **boards with 3-star Azir**; no wider comp was specified. The active analysis scope contains **192,344 boards**, of which **546** have 3-star Azir.

Read	Boards	Avg. placement	Top 4	Win
3-star Azir, any items	546	4.33	51%	10%

Read	Boards	Avg. placement	Top 4	Win
3-star Azir, exactly 3 completed items, holding Guinsoo's Rageblade	325	4.22	55%	11%
Same 3-item Azir/Rageblade condition, with Spellweaver active	129	3.43	71%	19%

The overall 3-star Azir result is **0.17 placement better** than the 191,798-board complement (4.50); the 95% confidence interval for that difference runs from -0.35 to +0.02, so the overall edge is not conclusive. ~~The three-item Rageblade cohort is suggestive, not a controlled item comparison.~~

Where might a mana slot be more worthwhile? There isn't a reportable 3-star Shojin comparison to point to. In the Spellweaver context, the 3-star Azir/Shojin side fell below the 50-board reporting threshold, while the 3-item Rageblade side had 129 boards and placed well. That makes Spellweaver a context worth noticing, **not evidence that Shojin would improve it.**

As a broader, all-star-level cross-check, Shojin on Azir appears on **343 boards** (4.74 average, 47% top four, 9% wins); Rageblade appears on **1,729 boards** (4.49, 51%, 11%). That's observational and not limited to 3-star Azir, so don't read it as a clean head-to-head.

Limit: The exact Shojin-on-3-star-Azir sample is suppressed below 50 boards, and the exact loadout query returned no reportable rows for the specific two-item pairing. The data therefore can't settle Shojin versus a particular Guinsoo-plus-two-damage build, or establish when mana is worth the slot.

UN4-2-C03

Prompt

Does AP Nidalee with a Rapidfire emblem actually outperform ordinary AP builds, or is it mainly showing up on much stronger endgame boards?

Final output

Practical read: I wouldn't choose Rapidfire Emblem as an AP upgrade for Nidalee based on these results. The emblem's good-looking numbers are concentrated on level-9 boards; at the same level and Nidalee star, it performs about even with ordinary AP-item cohorts—not better in a convincing way. At level 8, it trails them clearly.

Scope and comparison: Active analysis scope: **192,344 boards**. I treated "Rapidfire AP Nidalee" as Nidalee holding the exact Rapidfire Emblem, compared with Nidalee holding a named AP item. The level-matched comparisons below also require **2-star Nidalee**. This is not a single composition shell; it is a holder-and-board-level comparison.

What does this mean?

Nidalee holding...	Level 8, 2-star	Level 9, 2-star
Rapidfire Emblem	148 boards ; avg. placement 5.49 , top four 27% , wins 1%	99 boards ; 3.37 , 75% , 9%
Rabadon's Deathcap	261 boards ; 4.28 , 52% , 10%	147 boards ; 3.33 , 76% , 17%
Jeweled Gauntlet	540 boards ; 4.68 , 47% , 6%	299 boards ; 3.64 , 70% , 11%

At level 8, Rapidfire's target-minus-baseline placement was **+1.21** vs Deathcap (95% CI **+0.84 to +1.58**) and **+0.81** vs Jeweled Gauntlet (**+0.49 to +1.13**): worse in both comparisons. At level 9, it was **+0.04** vs Deathcap (**-0.40 to +0.48**) and **-0.27** vs Jeweled Gauntlet (**-0.64 to +0.11**). Those level-9 placement differences are inconclusive; Rapidfire's observed win rate was lower than both comparators.

Itemization signal: No Nidalee loadouts pairing Rapidfire Emblem with Deathcap, Jeweled Gauntlet, or Archangel's Staff were returned, even without a sample cutoff. The only reportable three-item Rapidfire loadout was **Infinity Edge + Rapidfire Emblem + Sterak's Gage** (**55 boards**; avg. placement **4.96**, top four **38%**, wins **2%**). For contrast, **Guinsoo's Rageblade + Jeweled Gauntlet + Rabadon's Deathcap** appeared on **101 boards**, with avg. placement **4.22**, top four **58%**, and wins **10%**. These loadouts are not level-matched, so treat that as item-allocation context, not a clean head-to-head.

Once you identify an insurmountable data lacking, cite it and then stop there. The user can follow up if they want.

I like this response a lot. Leads with brief data, then gives a grounded and explicit conclusion. It does not overstate or over-explain and waste the user's time.

Rapidfire Nidalee appeared on **340 boards** overall; among boards level 8+, **195** were level 8 and **117** level 9. The sharp level-8-to-level-9 outcome gap, alongside the lack of a reportable AP-plus-Rapidfire build, points more toward board-level endgame selection than a demonstrated AP synergy. ~~The comparisons are observational, and item cohorts can overlap; they do not show that the emblem caused the outcome.~~

UN4-2-C04

Prompt

A simulator suggested double Blue Buff for Ahri. Do two-star Ahri endgame boards with that build actually hold up against a single mana item and two damage items, and does the surrounding board change the comparison?

Final output

Practical read: I can't validate double Blue Buff on two-star Ahri from this data: it has **fewer than 50 reportable boards**. Even across the broader analyzed scope. The closest useful comparison is encouraging for **one Blue Buff plus Jeweled Gauntlet and Striker's Flail**: it outperforms a common alternative, Jeweled Gauntlet + Spear of Shojin + Striker's Flail. That comparison stays similar on boards with Blossom or Spellweaver active; it does **not** establish that double Blue Buff works.

Scope: The operational endgame shell is **two-star Ahri with exactly three completed items at level 8+**: **21,826 boards** within an active analysis scope of **192,344 boards**. The double-Blue-Buff loadout had no reportable rows in the loadout ranking, and its direct comparison's count and outcomes were suppressed below the 50-board threshold.

Ahri loadout / context	Boards	Avg. placement	Top four	Wins
Blue Buff + Jeweled Gauntlet + Striker's Flail	715	4.03	60%	13%
Jeweled Gauntlet + Spear of Shojin + Striker's Flail	3,748	4.31	54%	10%

The direct target-minus-baseline comparison favors the one-Blue-Buff build: **-0.28 placement** (95% CI -0.45 to -0.11), **+6 percentage points top-four** (CI +2 to +10), and **+3 percentage points wins** (CI +1 to +6). The build's 4.03 average is also better than the 4.5 lobby baseline. The 715-board result is solid by the store's threshold; the 3,748-board comparator is also solid.

Does the surrounding board change it? In the Blossom-active slice, the same builds posted **4.02 / 61% top-four / 13% wins** on 654 boards versus **4.29 / 54% / 9%** on 3,505. With Spellweaver active, they posted **4.03 / 60% / 13%** on 692 versus **4.30 / 54% / 10%** on 3,634. So these two trait-conditioned comparisons look very similar to the overall comparison; neither makes a case for double Blue Buff. They only speak to boards where the named trait is active, not every possible surrounding board.

Cut the rest of the response.

~~Bottom line: One Blue Buff plus two damage items holds up well in the observed endgame sample against that common alternative. Double Blue Buff remains unproven, not disproven. Its sample is below the reporting threshold. These are final-board associations, not evidence that an item caused the placement difference.~~

UN4-3-C01

Prompt

Is Ahri actually Morgana's best carry partner, or do Morgana boards do just as well with Sivir?

Final output

Practical read: Ahri is Morgana's much more common partner, but the data does **not** show that Morgana-Ahri boards outperform Morgana-Sivir boards. Sivir looks like a credible alternative in the observed matches, ~~not a much better one, but her carry partner's sample is far smaller, and therefore it is too noisy to separate the numbers.~~

Definition and scope: I treated "Morgana boards" as any board containing Morgana, then compared boards also containing Ahri against boards also containing Sivir. That is **26,971 Morgana boards** overall: **17,584** had Ahri, versus **575** with Sivir. The two partner cohorts overlap on **143 boards**, so this is not a disjoint head-to-head.

Unit	What the Morgana-board data says	Read
Morgana — cost 4	Across all 26,971 boards, she was 2★ on 22,162 : 4.27 average placement, 55% top four, 12% wins. At 1★ (4,693 boards), outcomes were 5.95 / 22% / 5% .	The defining unit of this sample; the large 2★/1★ outcome gap is an association, not proof of upgrade impact.
Ahri — cost 4	Appeared with Morgana on 17,584 boards. At 2★ (15,345	The frequent partner—about 65% of Morgana boards. The

There's zero reason to display like this instead of other, directly tabular forms

Unit	What the Morgana-board data says	Read
	Morgana boards): 4.25 average, 55% top four, 10% wins; at 1★ (2,109): 6.40 / 15% / 2% .	data supports "common," not "best carry partner."
Sivir — cost 4	Appeared with Morgana on 575 boards. At 2★ (374 boards): 4.07 average, 59% top four, 15% wins; at 1★ (200): 5.62 / 32% / 3% .	A much less common alternative. Its 2★ results are competitive, but the sample is only suggestive.

There is no way this will be useful to a user

On the direct partner comparison, Morgana–Ahri averaged **4.49** placement (**51%** top four, **10%** wins; 17,584 boards) versus **4.61** (**49%**, **11%**; 575 boards) for Morgana–Sivir. The target-minus-baseline estimates were **-0.12 placement** (95% CI **-0.31 to +0.07**), **+1 percentage point** top-four rate (CI **-3 to +5**) and **-1 point** win rate (CI **-4 to +1**). Those intervals include no difference; they don't establish Ahri's advantage, nor prove the partners are equivalent.

Bottom line: Ahri is the default by frequency, but "actually Morgana's best carry partner" is stronger than these stats support. Sivir boards do about as well in this observed comparison, with much less evidence behind the estimate. No item-specific comparison or control for board composition was available here, and final-board snapshots can't establish which unit was the actual carry.

UN4-3-C02

Prompt

Which Aphelios boards actually do well with Mama Beak, and which do better without her?

Final output

Practical read: Mama Beak is a poor fit in the common **level-8 Aphelios** boards, but Aphelios boards with her look modestly better at **level 9**—especially when **Elderwood is Bronze**. **Without her** is the better observed outcome for level-8 Aphelios boards and Aphelios boards with **Silver Lunar**. ~~This is an association, not evidence that adding or removing her causes the result.~~

Scope: Boards containing Aphelios: **28,964 total**. The comparison is Mama Beak present (**12,296 boards**) versus absent (**16,668**), within that Aphelios population. ~~Lower average placement is better; 4.5 is the lobby baseline.~~

Never remind the user of something so basic

Aphelios board slice	Mama Beak present	Without Mama Beak	Read
All Aphelios boards	12,296 boards; avg 4.69, top 4 47%, wins 7%	16,668 boards; avg 4.35, top 4 53%, wins 12%	Overall, boards with her place 0.34 worse , with top-4 rate 6 pp lower and win rate 4 pp lower .
Level 8	7,447 boards; avg 5.60, top 4 28%, wins 1%	8,232 boards; avg 5.07, top 4 39%, wins 5%	Clearer case for without her : present boards are 0.53 placements worse and 11 pp lower on top fours.
Level 9	4,225 boards; avg 3.36, top 4 76%, wins 14%	6,132 boards; avg 3.51, top 4 71%, wins 16%	With her is modestly better on placement (0.15) and top fours (5 pp), but not on wins.
Level 10	479 boards; avg 1.87, top 4 99%, wins 42%	1,102 boards; avg 1.95, top 4 95%, wins 46%	Both groups are very strong; this does not establish a Mama Beak edge. The with-her sample is suggestive-sized, and the placement difference is uncertain.

The best specific with-her slice returned was **level 9 + Bronze Elderwood**: Mama Beak present had **301 boards** (avg **3.21**, top 4 **75%**, wins **21%**), versus **855** without her (avg **3.66**, top 4 **64%**, wins **25%**). That's a promising placement/top-four signal, not a win-rate advantage; treat it as suggestive, not definitive.

A counterexample: in **Silver Lunar** Aphelios boards, her presence was associated with worse results—**2,659 boards**, avg **4.25**, top 4 **56%**, wins **10%** with her, versus **3,729** without, avg **3.80**, top 4 **64%**, wins **16%**. So "Aphelios + Mama Beak" is not uniformly a strong shell; the level-9/Elderwood read is more favorable than the Lunar one.

The level-8 versus level-9 split matters: level-8 boards containing both Aphelios and Mama Beak were mostly **level 8 / board size 8 (6,795 boards, avg 5.63, top 4 27%)**, while the most common level-9 / board-size-9 slice was much stronger (**3,670 boards, avg 3.33, top 4 76%**). Those are her boards only, not a matched board-size comparison against boards without her. Final-board snapshots also can't establish when she was acquired or whether she displaced another unit.

UN4-3-C03

Prompt

On finished Draven boards, when does giving Kennen the secondary damage items work better than leaving them on Gnar or Ezreal?

Final output

Practical read: In boards containing Draven, Kennen, Gnar, and Ezreal, Kennen's item allocation is associated with better results when the alternative holder is left with **zero completed items**. The edge is modest versus itemized Gnar and larger versus itemized Ezreal. ~~This is an allocation proxy—not proof about specific "secondary damage" items.~~

Scope: 13,379 boards with all four units present. Since no item names were specified, "itemized" here means at least one completed item on that unit; this does **not** isolate damage items.

Presentation is good

Allocation comparison	Kennen has ≥ 1 item; other unit has 0	Kennen has 0; other unit has ≥ 1 item	Target-minus-baseline
Kennen vs. Gnar	4,958 boards; avg placement 3.85 , top four 58% , wins 27%	1,806 boards; 4.14 , 54% , 21%	-0.29 placement; +5 pp top four; +6 pp wins
Kennen vs. Ezreal	3,193 boards; avg placement 3.76 , top four 61% , wins 29%	2,816 boards; 4.54 , 46% , 19%	-0.78 placement; +15 pp top four; +10 pp wins

So, **Kennen over Ezreal is the clearer observed lean**; over Gnar, the advantage is smaller. The comparisons hold the four-unit shell fixed, but are observational, not causal. The tool flagged some cohort overlap below its 50-board reporting threshold, likely due to boards with multiple copies matching different item-count conditions. Final-board data also can't establish exact item identities, when items were moved, or what happened earlier in the game.

UN4-3-C04

Prompt

For finished Spellweaver boards with Fiddlesticks tanking, does adding another Defender actually outperform using that slot for another carry or support?

Final output

Practical read

No—on final boards, the active-Defender version underperforms the same Fiddlesticks + active Spellweaver shell without active Defender. The edge points toward using that slot budget for a high-value carry or support rather than forcing Defender activation. The clearest alternative-unit signals here are **Kennen** and **Soraka**.

Composition definition and sample

Operationally, I treated “Fiddlesticks tanking” as **Fiddlesticks present**—the data doesn’t establish his board position. The shell is final boards with Fiddlesticks and active Spellweaver:

- **Defender active**: 16,202 boards; average placement **4.45**, top-four **51%**, win **12%**.
- **Defender inactive**: 7,361 boards; average placement **4.29**, top-four **55%**, win **13%**.

This can be established by number and type of items he is holding

Active minus inactive: **+0.15 placement** (worse; 95% CI +0.09 to +0.21), **-4 percentage points top-four** (CI -5 to -2), and **-1 point win rate** (CI roughly -2 to 0). Both groups exceed 500 boards; average placement is better when lower, with 4.5 as lobby baseline.

Unit	Observed signal in this shell	Cost; star profile	Board outcomes and evidence-based read
Fiddlesticks	Present on all 23,563 shell boards.	3-cost . In the broader Fiddlesticks + Spellweaver sample, 2★ with 0 completed items: 10,580 boards ; 2★ with 3 items: 3,421 boards .	The core anchor by the population definition ; the Defender split above is the relevant shell outcome, not a separate causal estimate for Fiddlesticks. Presence alone doesn't prove he was actually tanking.
Rammus	Most common example of the active-Defender side: 9,104 boards (56% of active-Defender boards) .	3-cost ; 2★ appears on 5,453 boards, 3★ on 3,061 in the Fiddlesticks + active Spellweaver + active Defender cohort.	Boards with Rammus: 4.44 average, 51% top-four, 10% wins (N=9,104). Common Defender piece, but its presence doesn't reverse the weaker active-Defender aggregate.
Kennen	Appears on 3,637 boards (49% of Defender-inactive boards).	5-cost ; 1★ on 2,319 boards and 2★ on 1,319 in the Fiddlesticks + Spellweaver, Defender-inactive cohort.	Boards with Kennen: 3.33 average, 75% top-four, 19% wins (N=3,637). Strong carry-side association; 2★ Kennen's boards are 2.47 / 89% / 32% (N=1,319), suggestive but selected.
Soraka	A frequent support-side alternative: 5,231 boards (71% of Defender-inactive boards).	4-cost ; 2★ appears on 4,516 boards in the Fiddlesticks + Spellweaver + Soraka, Defender-inactive cohort.	Boards with Soraka: 3.95 average, 62% top-four, 14% wins (N=5,231). More common than Kennen, with a positive association versus the inactive-Defender cohort overall.

Bottom line: the broad comparison favors **not forcing active Defender**; Rammus is common, but the best carry/support associations are on the other side. This is not proof that a specific one-slot swap causes the gain. Defender-inactive boards can still contain Defender units, and the cohorts aren't controlled for board size or exact unit-for-unit substitutions. Unit-presence

outcomes can also overlap. For comparison, omitted **Alune** is another strong high-cost signal in Defender-inactive boards: **3.71 average, 66% top-four, 17% wins** (N=3,979).

UN4-3-C05

Prompt

In finished Draven boards, is two-star Taric still better than two-star Amumu when Taric has no Vanguard active but Amumu has Juggernaut?

Final output

Short read: no—not in the cleaner, non-overlapping comparison. Among Draven boards with exactly the requested star levels and trait conditions, boards with 2★ Amumu and active Juggernaut outplaced boards with 2★ Taric and no active Vanguard. The Taric-only sample is much smaller, so treat that result as suggestive, not definitive.

Scope: Finished boards containing Draven; no other composition, level, or item constraints. For the direct comparison, I excluded boards containing the other unit so the cohorts would not overlap.

Cohort	Boards	Avg. placement	Top 4	Wins
2★ Taric, Vanguard inactive; no Amumu	227	4.44	46%	19%
2★ Amumu, Juggernaut active; no Taric	1,990	3.93	59%	25%

The comparison's target-minus-baseline effects were **+0.51 placement** (95% CI +0.17 to +0.85), **-13 percentage points top 4** (-20 to -6), and **-6 points wins** (-11 to -1), with **0 overlapping boards**. Lower placement is better. Taric is a 5-cost and Amumu a 4-cost in the supplied roster, but these results do not show whether the cost or any unit-specific role caused the gap.

One caveat changes the read: without excluding the other unit, the Taric cohort had a slightly better average placement than the Amumu cohort—**2.95 (n=5,837) vs. 3.11 (n=13,217)**—and higher top-4/win rates (**75%/40% vs. 73%/37%**). But **3,943 boards belonged to both cohorts**, so that is not a clean head-to-head; it is not evidence that Taric is better when the units are competing alternatives.

The Taric-only result clears the 50-board reporting threshold but is still a small, suggestive sample. These are final-board associations, not a causal estimate of either unit's value.

UN4-3-C06

Prompt

Which finished carry cores actually perform well with Sett as the main tank, and does that hold without a Ravager emblem on him?

Final output

Practical read: Yes. With Sett holding three completed items, three-item Ashe, Alune, and Gnar all post strong results; Master Yi also looks good, but mainly when three-starred. The results are overwhelmingly from boards **without** a Ravager Emblem on Sett. The

emblem-specific samples are too small to measure separately, so there's no reliable evidence that he needs it.

Composition definition and scope

I treated “main tank” as **Sett with exactly three completed items**, and a “finished carry core” as another unit on the same board with exactly three completed items. That shell contains **24,990 boards** (4.26 average placement, 55% top four, 12% wins). No set or patch filter was added. Carry cohorts overlap, so their board counts are not additive.

Three-item unit	Cost	Boards in Sett shell	Avg. placement	Top four	Wins	Evidence read
Ashe	5	4,634	3.50	69%	20%	Strong, frequent core. At two-star: 3,001 boards, 2.92 average, 81% top four, 27% wins.
Alune	5	2,830	3.42	72%	20%	Stronger placement than Ashe overall. At two-star: 1,963 boards, 2.95 average, 80% top four, 25% wins.
Gnar	5	2,182	3.38	72%	21%	Best average among these overall; at two-star, 1,236 boards, 2.75 average, 83% top four, 30% wins.
Master Yi	3	1,938	3.69	66%	16%	Positive overall, but the star split matters: three-star has 1,514 boards at 3.23 average and 75% top four; two-star has 411 boards at 5.35 average and 32% top four.

All four overall cohorts are well above the 4.5 lobby baseline, with large samples. The star splits suggest the strongest signals are associated with upgraded carries—especially Gnar, Ashe, and Alune at two-star, and Master Yi at three-star. That is an observed association, not proof that upgrading alone caused the result.

The Ravager Emblem check: For each listed carry, the cohort with both three-item Sett and the three-item carry **and** a Ravager Emblem held by Sett fell below the 50-board reporting threshold. So I can't give a trustworthy emblem-versus-no-emblem effect. But because those emblem-held samples are under 50 against carry cohorts of **1,938–4,634 boards**, nearly all

of the performance shown above is from boards without the emblem. The evidence supports these cores working without it; it does **not** establish what the emblem does to their results.

One useful contrast: three-item Ahri and Morgana are much more common alongside three-item Sett—15,933 and 10,092 boards, respectively—but their averages are 4.22 and 4.11, with 56% and 58% top-four rates. Frequency alone does not make them the stronger finished cores in this shell.

Limit: “Three-item” records completed-item count, not the exact builds. Final-board data also can’t establish when units were bought or whether they were the early-game plan.

UN4-4-C01

Prompt

How do Soraka and Zyra boards with Lillia as the main tank compare with similar boards using Malphite? Are there versions where Lillia holds up, or is she usually a weaker substitute?

Final output

Practical read: In Soraka–Zyra boards, Lillia can appear on boards that perform respectably, especially at 2★—but the cleaner “Lillia instead of Malphite” comparison favors Malphite. Treat Lillia as a weaker substitute on this evidence, not an equivalent tank swap. The Lillia-only sample is much smaller, and these are final-board associations, not a controlled test of tank quality.

Composition definition and sample

I define the shell as boards containing **Soraka and Zyra: 21,004 boards**. To test the swap, I compare boards with both plus **Lillia and no Malphite** against boards with both plus **Malphite and no Lillia**. Those exclusive groups have **287** and **17,318** boards, respectively. The comparison does not control for level, traits, items, or other board differences.

Unit	Cost	Evidence in the Soraka–Zyra shell
Soraka	4	2★ on 18,088 boards: 4.24 avg placement , 56% top-four, 10% win rate. At 1★: 2,832 boards, 6.27 avg . A frequent shell piece; the 2★ results are solid-sample association, not proof of causal value.
Zyra	4	2★ on 17,736 boards: 4.20 avg placement , 57% top-four, 10% win rate. At 1★: 3,174 boards, 6.26 avg . Similarly frequent and strongly associated with the shell’s better results at 2★.
Malphite	4	2★ on 16,592 boards: 4.12 avg placement , 59% top-four, 11% win rate; 1★ on 3,175 boards:

Unit	Cost	Evidence in the Soraka–Zyra shell
		6.30 avg. The much more frequent observed tank choice, with a large 2★ sample.
Lillia	4	2★ on 1,929 shell boards: 4.29 avg placement , 55% top-four, 11% win rate; 1★ on 844 boards: 4.94 avg . She shows up successfully in the broader shell, but these rows include boards that may also field Malphite.

The substitution read

In the **exclusive** comparison, Lillia boards averaged **4.90** placement (**287 boards**) versus **4.47** for Malphite boards (**17,318 boards**); top-four rates were **46% vs. 52%**, and win rates **8% vs. 9%**. The target-minus-baseline estimates were **+0.43 placement** (95% CI **+0.17 to +0.69**) and **–6 percentage points top-four** (95% CI **–12 to roughly 0**); the **–1-point win-rate** estimate was uncertain (95% CI **–4 to +2**). Lillia’s 4.90 average is also below the 4.5 lobby-placement benchmark.

A same-star check points the same way: with Soraka and Zyra present, **2★ Lillia without Malphite** averaged **4.73** over **233 boards**, versus **4.14** for **2★ Malphite without Lillia** over **14,536 boards**. That is suggestive, not a balanced comparison, given the sample-size gap.

Bottom line: Lillia 2★ can fit into respectable Soraka–Zyra boards, but the evidence does **not** show her holding up as well when she is the Malphite replacement. Both are 4-cost units; the data does not support a cost-tier advantage for the swap. The shared-shell rows also show **Amumu 2★** as a strong omitted alternative—**4.02 avg placement on 12,961 boards**—and **Fiddlesticks 2★** as a common one (**4.29 on 16,568**).

Limitations: The comparison identifies board presence, not actual positioning, item ownership, or whether the named unit was the primary tank. It is observational and does not control for level, trait setup, or itemization. The Lillia-only sample is suggestive; the Malphite sample is solid.

UN4-4-C02

Prompt

Is Ashe really the better carry than Draven on Maokai endgame boards, or are they succeeding in different versions of the board?

Final output

Short read: Ashe wins the broad Maokai endgame comparison on average placement and top-four rate, but not on win rate—and that aggregate makes the two look more interchangeable than they are. Ashe is almost always in a **Blossom/Hunter** version; Draven is almost always in a **Bounty Seeker/Inferno/Executioner** version. When I compare them within shared Hunter or Blossom contexts, Draven's win rate is higher, while placement and top-four differences are inconclusive. So: Ashe is ahead across the full mix, but this is largely a comparison of different board versions, not a clean verdict that she is the better carry.

Scope

I operationalized “endgame” as **level 8 or higher** and the shell as **Maokai present: 41,896 boards**. Ashe boards: **8,318**; Draven boards: **21,728**. The groups overlap on **1,619 boards**, so this is not a disjoint head-to-head.

Unit read

Unit	Why it matters; cost and star profile	Outcomes in this scope	Evidence-based read
Ashe	5-cost ; 2★ on 4,989 boards (about 60% of her 8,318-board cohort), 1★ on 3,334 .	Across her 8,318 boards: 3.65 average placement, 64% top-four, 27% wins.	Commonly allocated as the carry candidate in this shell; the aggregate results are strong, but do not establish that Ashe herself causes them.
Draven	5-cost ; 2★ on 15,057 boards (about 69% of his 21,728-board cohort), 1★ on 6,680 .	Across his 21,728 boards: 3.93 average placement, 58% top-four, 27% wins.	More frequent and more often 2★ than Ashe in this shell. That does not translate into a higher overall win rate here.
Maokai	5-cost , shared shell unit. He was 2★ on 4,489 Ashe boards and 13,872 Draven boards; 1★ on 3,834 and 7,872 , respectively.	Maokai’s 2★ boards averaged 2.76 placement with 79% top-four on the Ashe cohort (4,489 boards), versus 3.00 and 74% on the Draven cohort (13,872). At 1★, the corresponding figures were 4.69 and 46% (3,834 boards) versus 5.57 and 28% (7,872).	The shared shell anchor, not a differentiator between the carries. The star-level split is a major caution: outcomes vary sharply with the board’s investment state.

Broad comparison: Ashe’s target-minus-Draven difference was **–0.29 placement** (95% CI **–0.34 to –0.23**) and **+6 percentage points top-four** (CI **+5 to +7 pp**); win-rate difference was effectively zero (CI **–1 to +1 pp**). Counts were **8,318 Ashe boards** and **21,728 Draven boards**. That supports Ashe as the aggregate placement/top-four leader, not a win-rate leader.

Why “different versions” is the better read: On Ashe boards, **Hunter** appeared on **8,281 of 8,318** and **Blossom** on **8,286**. On Draven boards, **Bounty Seeker** appeared on **21,703 of 21,728**, **Inferno** on **20,968**, and **Executioner** on **19,939**; Hunter appeared on **1,861** and Blossom on **2,687**. These are sharply different trait mixes.

The within-trait comparisons qualify the broad result. Among level-8+ Maokai boards with **Hunter**, Ashe had **3.50** average placement, **67%** top-four, and **27%** wins (**5,447 boards**); Draven had **3.35**, **69%**, and **35%** (**692 boards**). Among those with **Blossom**, Ashe had **3.56**, **65%**, and **26%** (**2,303 boards**); Draven had **3.49**, **66%**, and **35%** (**274 boards**). In both, Draven's win-rate edge is the clearest difference; placement and top-four intervals include no difference. The Draven samples are smaller, especially Blossom, and these comparisons still overlap (**626 Hunter boards; 189 Blossom boards**).

Bottom line: Don't treat Ashe's better aggregate placement as proof she universally outcarries Draven on Maokai boards. Ashe is the much more common Blossom/Hunter allocation and looks better in the mixed population; Draven is more concentrated in a different trait package and has the higher observed win rate in the shared Hunter/Blossom subsets. These are final-board associations, not causal carry-value estimates; this comparison also does not establish which itemization is better.

UN4-4-C03

Prompt

Among finished Draven–Maokai boards, how do the Elder Dragon and Ezreal versions compare for top fours and wins once board size, upgrades and emblem differences are accounted for?

Final output

Practical read: In the full Draven–Maokai shell, Elder Dragon looks modestly ahead of Ezreal overall. But once Draven and Maokai are both 2-star, that edge nearly disappears in the pooled comparison; board-size slices point in different directions. So the available evidence

does **not** establish that Elder Dragon is better after fully accounting for board size, upgrades, and emblems.

Scope: Finished boards containing both Draven and Maokai; no additional patch or set filter. The shell has **21,730 boards**. Elder Dragon appears on **5,853**, Ezreal on **14,401**; **601 boards contain both**, so these are overlapping versions, not a disjoint head-to-head.

Comparison	Elder Dragon	Ezreal	Elder minus Ezreal
All Draven–Maokai boards	Top four 61% (5,853 boards) ; wins 29% (5,853)	Top four 57% (14,401) ; wins 27% (14,401)	+4 pp top fours (95% CI +3 to +6); +2 pp wins (+1 to +4)
Draven 2-star and Maokai 2-star	Top four 86% (3,134) ; wins 48% (3,134)	Top four 84% (7,431) ; wins 47% (7,431)	+1 pp top fours (95% CI roughly 0 to +3); +1 pp wins (–1 to +3)

The second row is the cleaner upgrade check: with both core units at 2-star, the pooled gap is small and the win-rate interval includes no difference. As a further upgrade-state check, among **2-star Draven / 1-star Maokai** boards, Elder Dragon has a **50% top-four rate and 14% win rate (1,015 boards)** versus Ezreal’s **42% and 12% (2,571)**—a suggestive result, but not a full adjustment across upgrade states.

Board-size check, with both Draven and Maokai 2-star: these are separate descriptive slices, not a standardized comparison.

- **8 units:** Elder Dragon **76% top fours / 33% wins (1,610 boards)**; Ezreal **65% / 21% (146)**.
- **9 units:** Elder Dragon **97% / 64% (1,369)**; Ezreal **75% / 34% (4,034)**.
- **10 units:** Elder Dragon **95% / 62% (109)**; Ezreal **97% / 64% (3,002)**.

That spread matters: the versions have different board-size mixes, and the within-size read is not uniformly in Elder Dragon’s favor. The 8- and 10-unit Ezreal/Elder samples are also quite imbalanced; the smallest slices are only suggestive.

Limit: The comparison tool can condition on named unit star levels, but it cannot directly match or standardize these versions by board size and emblem configuration, nor cleanly require the absence of other emblems. The overall comparison is observational, and the cohorts overlap. A custom conditional audit is needed to answer “once all three are accounted for” rigorously; I’d hand that analysis to **data_analyst**.
